

INCOMING TRANSMISSION · REVERSA TRACK

Three signals from the regulatory void.

Three challenges. Twelve hours. No data handed out. A hidden test decides who wins.

MADRID OPEN · MAD TECH CAMPUS · 03.10.2026

HOW THIS WORKS

The track is open. We recommend three real problems.

THE OPEN TRACK

Parliamentary Transcripts

It is there if you want it: build whatever you like on what is said and voted in parliament. Judged by the jury.

OUR RECOMMENDATION

Three real Reversa problems

Challenges our team is working on today, and the ones we think are better. Each has a hidden test and a scoreboard.

THE CATCH

No data handed out

12 hours. Every dataset is public, and finding it is part of the challenge. We tell you where to look, not what to download.

HOW WE PICK A WINNER

At 19:00 we publish the test inputs. You run your model and submit a CSV by 20:00. We score it against answers you have never seen.

NO LEGAL BACKGROUND NEEDED

Each challenge starts with a one-page primer: how the law works, in plain words, with a real example.

How a law is made, in six steps

01

Proposal

The Government sends a bill. A parliamentary group can also propose one.

02

Green light

For bills from groups, the plenary first votes whether to debate it at all.

03

Amendments

Groups table changes to the text, article by article.

04

Committee

A small group of deputies negotiates and rewrites the text.

05

Votes

Congress votes. The Senate has two months to amend or veto.

06

Publication

It becomes law when published in the official gazette, the BOE.

THE MATHS

350 deputies. 176 is an absolute majority. No party has it alone, so every law is a coalition deal.

THE GRAVEYARD

Many bills never make it. When parliament is dissolved, everything still in progress dies.

THE EU VERSION

The Commission proposes, anyone can comment in a public consultation, Parliament and Council amend, then it is published.

THE TRACK • OPEN

Parliamentary Transcripts

Every word said in the Spanish Congress, every vote by every deputy. It is there if you want it: build anything on it.

JUDGED BY THE JURY

REVERSA × MADRID OPEN

WHAT IT IS

The Diario de Sesiones transcribes, word for word, every plenary and committee session. Alongside it: how each deputy voted, and every bill with its stages.

WHERE IT LIVES

congreso.es/es/datos-abiertos: interventions, votes, deputies and initiatives. For the EU: HowTheyVote.eu, on GitHub, updated weekly.

IDEAS

A virtual parliament with one agent per group, trained on its speeches and votes. A detector of what a group says versus how it votes. An early warning that a coalition is cracking.

JUDGED ON

Ambition, use of real data, and a demo that works live.

Real problems our team is working on

CHALLENGE 01

Law × Markets

Predict how much a law moves stock prices, and why.

DIFFICULTY 4/5

CHALLENGE 02

Bill-to-Law Predictor

Will this bill become law?
When? In what form?

DIFFICULTY 4/5

CHALLENGE 03

Influence Graph

Who really wrote this amendment?

DIFFICULTY 5/5

CHALLENGE 01 • BRIEF

Law x Markets

Laws cost money. Markets price that in before anyone else. Measure it.

DIFFICULTY 4/5

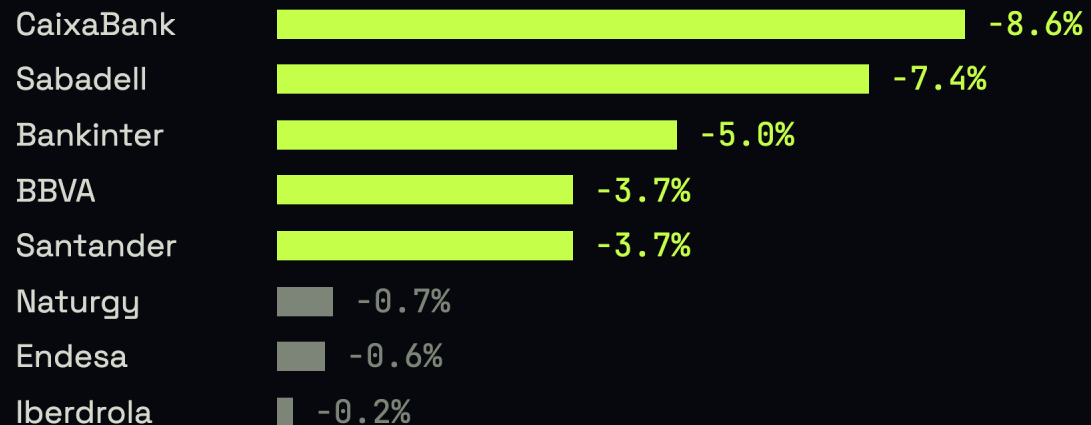

SOURCE: EURONEWS / REUTERS, 12.07.2022

IN PLAIN WORDS

A stock moves for many reasons. The abnormal return is the part the market as a whole does not explain: the stock's move minus what the IBEX 35 did. That is the signal you hunt.

REAL EXAMPLE • 12 JULY 2022 • SPAIN ANNOUNCES A TEMPORARY TAX ON BANKS AND ENERGY FIRMS

Banks (green) fell hard that day. Utilities (grey) barely moved. Why the difference? That is the question.

Three layers, from signal to euros

LAYER 1 · SIGNAL

Event dataset

At least 30 regulatory milestones that hit listed Spanish companies: announcement, cabinet approval, vote, publication. Add news volume and tone around each one.

LAYER 2 · EXPLAIN

What moves the price

Model the abnormal return. Rank the variables: stage, surprise, media noise, vote margin, how exposed each company is.

LAYER 3 · SIMULATE

Monte Carlo in euros

Pick one pending rule and one company. Run 10,000 scenarios: passes or not, when, how strict. Output the impact in € as P10 / P50 / P90.

WHERE THE DATA LIVES

Prices: yfinance (IBEX 35 and members). News: GDELT, free.
Milestones: BOE open data, Congreso initiatives, Council of Ministers press references on lamoncloa.gob.es.

YOU SUBMIT (CSV)

event_id, ticker, direction (+1/-1),
abnormal_return_pct, p10, p90
Window: event day plus the next trading day, versus
IBEX 35.

Beat the market on events you have never seen

Metric	Bad	Good	Excellent
Direction hit rate on 10 hidden events	Below 55%	65% or more	75% or more
80% interval contains the real move	Under 50% or absurdly wide	70% to 90% of the time	75% to 85%, and narrow
Variable ranking	Changes when you drop one event	Stable on the hidden events	Stable, and explains the 2022 case

THE HIDDEN TEST

At 19:00 we publish 10 past events (date, what happened, which tickers). You predict. We compare with the real prices.

DISQUALIFIED IF

You look up the real prices for the test events, use raw returns without subtracting the market, or hand-pick events.

Bill-to-Law Predictor

Will this bill become law? When?
And what will it look like when it
gets there?

DIFFICULTY 4/5

IN PLAIN WORDS

Two kinds of bills: those the Government sends, and those a parliamentary group proposes. Both go through amendments, committee and votes before they become law.

THE MATHS

350 seats, 176 for a majority, no single party near it. Each bill lives or dies on which groups join. Past votes tell you who usually votes with whom.

WHY IT MATTERS

Companies and public affairs teams need to know whether there is still time to shape a bill, or whether it is too late.

THE TWIST

You predict with what was known on the day the bill was filed. Nothing later. That is what makes it hard.

Three predictions per bill

PREDICTION 1

Does it pass?

A probability between 0 and 1 that the bill is published as law in the BOE.

PREDICTION 2

When?

Days from filing to publication, for bills you think will pass.

PREDICTION 3 · BONUS

In what form?

Which articles survive, change or disappear between the first text and the final law.

WHERE THE DATA LIVES

Congreso open data: initiatives with every stage, votes by deputy, interventions. BOE open data for the final publication date and text.

YOU SUBMIT (CSV)

initiative_id, p_law, days_to_boe
bonus: initiative_id, article, survives / changed / removed

Beat the obvious rule

Metric	Bad	Good	Excellent
Pass or fail (Brier score, AUC) on 40 hidden bills	Does not beat the baseline	Beats it clearly	AUC above 0.85
Timing (mean error in days)	More than 120	Under 90	Under 45
Final form, bonus (F1 on articles)	Below 0.3	0.5	0.7 or more

THE BASELINE TO BEAT

Government bill passes, group bill fails. It is right more often than you would think.

DISQUALIFIED IF

Your model uses anything that happened after the filing date: later stages, votes or news.

Influence Graph

Who really wrote this amendment?
Prove it, even when they changed
the words.

DIFFICULTY 5/5

IN PLAIN WORDS

In the EU, the Commission proposes a law and opens a public consultation where anyone can send comments. Lobbyists must register. Then MEPs table amendments to the text.

THE PRECEDENT

In 2013, LobbyPlag showed that amendments to the EU data protection law (GDPR) had been copied word for word from lobby papers.

WHY IT MATTERS

Knowing who shapes a law, and how often they win, is how you plan your own position on the next one.

THE TRAP

Legal text is full of boilerplate. Two amendments can share half their words and have nothing to do with each other.

From text matches to a map of power

STEP 1 • MATCH

Amendment ↔ submission

Link each amendment to the consultation submissions it echoes, including paraphrases. Give every link a score.

STEP 2 • WEIGH

Influence score

Turn the links into a graph of organisations, MEPs and amendments. Who wins most often?

STEP 3 • PREDICT

What gets adopted

For each proposal in the consultation, the probability that it ends up in the final law.

WHERE THE DATA LIVES

The Commission's Have Your Say portal, Parliament committee amendments, the Legislative Observatory, the EU Transparency Register, LobbyFacts, EUR-Lex for the final text.

YOU SUBMIT (CSV)

```
pair_id, influence_score (0-1)
proposal_id, p_adopted (0-1)
```

Separate real influence from lookalikes

Metric	Bad	Good	Excellent
Precision in your top 20 of 60 hidden pairs	Matches boilerplate	70% or more	90% or more, paraphrases included
Recall on the 30 real pairs	Under 40%	60% or more	80% or more
Adoption prediction (AUC) on 20 proposals	Around 0.5, a coin flip	0.65 or more	0.75 or more

THE HIDDEN TEST

At 19:00 we publish 60 amendment–submission pairs: 30 real influence, 30 decoys that look alike. Plus 20 consultation proposals to score.

DISQUALIFIED IF

Pairs are labelled by hand instead of by your system.

THE DAY

Saturday, 09:00 to 21:00

09:00

Kickoff
presentation: teams
and challenges
confirmed.

09:30

Find and load your
data, until 11:00.

11:00

Build, until 19:00.

19:00

We publish the test
inputs.

20:00

CSV submitted.

20:00

Demos, [5] minutes
each, until 21:00.

60

Hidden test

Your CSV against answers you
have never seen.

20

Difficulty

Harder problems and bonus
layers score more.

20

Demo

Live, on real data, explained to
a non-lawyer.

Before Saturday: reply to our email by Friday with your team and your pick. Teams of three, your own tools, public data only. The top three re-run their pipeline live.

END OF TRANSMISSION

Choose your signal.
